

FAQ

PRODUCT

Is this an LMS?

No. Myelin is not an LMS.

An LMS is primarily designed to deliver and organize learning content—courses, lectures, videos, assignments, quizzes, and assessments. Myelin is designed around **decision practice**.

There are no chapters to complete before you can act. The learner enters a situation, receives information, makes decisions, allocates resources, and sees the simulated environment respond.

The important difference is the learning loop:

Situation → Decision → Consequence → New Information → Adaptation → Reflection

A student does not simply answer:

“What is the correct management decision?”

They have to make the decision and then deal with what that decision creates.

Myelin can therefore complement an LMS rather than replace it. A university can use its existing LMS for curriculum, content, assignments, and administration, while using Myelin for **experiential decision practice and simulation-based assessment**.

SCORING

How is my decision graded?

Myelin does not grade you simply on whether you “won.”

The simulation records the decisions you make throughout the experience and evaluates them against the situation, information available at the time, constraints, trade-offs, and consequences.

The current Myelin framework evaluates seven dimensions:

- **Strategic Thinking**
- **Capital Allocation**
- **Risk Management**
- **Systems Thinking**
- **Leadership & People Management**
- **Adaptability**
- **Long-Term Value Creation**

A strong outcome alone does not automatically mean a strong decision.

A student can make a sensible decision and still experience a poor external outcome. Conversely, a poor decision can occasionally produce a good outcome.

That distinction matters because Myelin is designed to evaluate **judgment**, not luck.

The final report therefore combines the student's overall performance with their decision history, quarter-by-quarter outcomes, strengths, mistakes, missed opportunities, and recurring patterns.

RUNS

Can I retake a simulation?

Yes. Retakes are designed for learning, not for simply replacing a bad result.

A second attempt gives the learner an opportunity to apply what they learned from the first experience. The purpose is to answer a more meaningful question:

Did you actually improve your decision-making after experiencing the consequences?

A retake can therefore reveal whether the student:

- recognized what went wrong,
- changed their assumptions,
- adapted their strategy,
- made better trade-offs,
- and avoided repeating the same mistakes.

For institutional assessment, Myelin should clearly distinguish between **first-run performance, subsequent attempts, and demonstrated improvement** rather than presenting the highest score without context.

ENGINE

Is the AI generating the scenarios?

AI can support scenario creation and adaptation, but AI is not the simulation itself.

Myelin's core experience is built around a structured decision environment containing:

- objectives,
- constraints,
- information,
- resources,
- stakeholders,
- decisions,
- consequences,
- and changing conditions.

The underlying simulation engine determines how decisions affect the state of the environment.

AI can make the experience more dynamic—for example, by supporting realistic interactions, communications, scenario variations, or adaptive content—but the business logic and consequence system remain structured and measurable.

That distinction is important.

AI generates or assists with parts of the experience.

The simulation engine determines whether the student's decisions actually matter.

REPORTS

Will recruiters actually use the DI Report?

The Decision Intelligence Report is not intended to replace a résumé, interview, degree, or professional experience.

Its purpose is to provide an additional source of evidence about **how a person approaches decisions in simulated situations**.

A conventional résumé tells an employer what someone has done.

A simulation can provide evidence about how that person behaves when they have to:

- make trade-offs,
- operate with incomplete information,
- manage risk,
- allocate limited resources,
- respond to changing conditions,
- and adapt when their assumptions prove wrong.

The report can summarize these patterns across the simulation and present the evidence in a structured format.

For universities, the same report can be used for **learning feedback and development**, rather than recruitment alone.

The important boundary is that Myelin should not claim:

“This report proves how you will perform at work.”

Instead:

“This report provides structured evidence of how you made decisions in the simulation.”

That distinction keeps the report credible.

PLANS

Is there a free tier?

Yes.

Myelin can provide an accessible entry point through selected free simulation experiences.

Paid plans can provide access to a broader set of simulations and deeper capabilities, while institutional plans can support cohort-level use, instructor visibility, reporting, and deployment across an educational program.

The exact commercial structure should be presented according to the current pricing model rather than making claims that are not yet finalized.

The underlying model is simple:

Experience Myelin first. Expand access when deeper learning, analytics, and institutional use require it.

COMPANY

Who is behind Myelin?

Myelin is built around a simple belief:

Judgment is not something you should have to wait years to develop.

Education gives people knowledge. Experience gives people consequences. Myelin is designed to create a place between the two where learners can **practice making consequential decisions before the stakes are real.**

The platform brings together simulation design, decision modeling, learning science, software engineering, and assessment to create experiences where the learner—not the instructor—is responsible for what happens next.

Rather than teaching one narrow subject, Myelin is being designed as a reusable decision-intelligence platform that can support different environments, from business and leadership to crisis, operations, and other organizational decision contexts.

The goal is simple: give people a place to practice judgment before the real world demands it.

Questions you *might have.*

Short answers about Myelin, our simulations, grading model, and who we are.

If it matters to institutions, it matters here.

7 DECISION DIMENSIONS

We evaluate decisions across seven core dimensions of human judgment.

Multiple SIMULATION WORLDS

Different industries, roles and contexts. One platform to practice them all.

Real CONSEQUENCES

Every decision changes the situation and affects what happens next.

No MODEL ANSWERS

No perfect answers. Just better decisions under real uncertainty.

FOR INSTITUTIONS

Bring Myelin into your **classroom.**

Give students a decision environment they can experience before you teach it.

[Request a Pilot →](#)

Tell us about your cohort. We'll recommend a pilot format and walk you through what students and faculty receive.

Cohort Overview

Students	Avg. Score	Decisions Made
52	68%	1,248

Decision Intelligence

OUR PILOT PROCESS

01 Tell us about your cohort

Share your institution, programme, approximate student count, and intended use.

02 We configure the pilot

We recommend the appropriate simulation(s), cohort size, and delivery format.

03 Students run the simulation

Students make decisions, experience consequences, and receive their individual results.

04 Faculty receives the outcome

Faculty receive the relevant performance and debrief information to discuss decision-making with the cohort.

YOUR PILOT INCLUDES

Student access
Access to the selected simulation for your cohort.

Individual results
Individual performance reports for every student.

Decision insights
Decision-making insights generated from the simulation.

Faculty debrief
Debrief material to facilitate classroom discussion.

Pilot support
Onboarding and support throughout the pilot.

Post-pilot discussion
A discussion on outcomes and next steps for your programme.

Institutional Trust — “Request a Pilot”

This is the one I'd add **immediately** because a professor/dean shouldn't have to figure out what happens after they become interested.

CTA

REQUEST A PILOT →

Under it:

See Myelin in your classroom before committing institution-wide.

Then show a very simple 4-step process:

01 — Tell us about your cohort

Share your institution, programme, approximate student count, and intended use.

↓

02 — We configure the pilot

We recommend the appropriate simulation(s), cohort size, and delivery format.

↓

03 — Students run the simulation

Students make decisions, experience consequences, and receive their individual results.

↓

04 — Faculty receives the outcome

Faculty receive the relevant performance and debrief information to discuss decision-making with the cohort.

What the institution receives

Put this directly below the steps:

YOUR PILOT INCLUDES

- **Student access** to the selected simulation
- **Individual performance results**
- **Decision-making insights** generated from the simulation
- **Faculty debrief material**
- **Pilot support / onboarding**
- **Post-pilot discussion** on outcomes and next steps

Only keep the items you can **actually provide today**.

The CTA section I'd actually put on the website

Bring Myelin into your classroom.

Give students a decision environment they can experience before you teach it.

Request a Pilot →

Tell us about your cohort. We'll recommend a pilot format and walk you through what students and faculty receive.

Then a small line:

For MBA programmes · Business schools · Universities · L&D teams

One important change

I would **not** make “Request a Pilot” sound like a sales-contact form immediately.

Make the first interaction feel like:

“Let's see whether Myelin fits your programme.”

That reduces the psychological barrier for a professor who is interested but isn't yet ready to “buy” anything.
